## Executive Summary

1. The proposed Wood Duck Springs Comprehensive Plan Amendment/Zone Change project will include the rezone of six properties located at/near 8208 NE 63<sup>rd</sup> Street in Vancouver, Washington. The proposal will rezone the properties from Urban Low Density (R-9) to Urban High Density (R-22) and Community Commercial (CC), where approximately one acre will be allocated to the CC zone. Future access to the site will likely be provided via a future north leg at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue.
2. The trip generation calculations show that under the existing R-9 zone, the subject site could reasonably generate up to 79 AM peak hour trips, 105 PM peak hour trips, and 1,050 average weekday trips. Under the proposed R-22 and CC zones, the site could reasonably generate up to 123 AM peak hour trips, 172 PM peak hour trips, and 2,184 average weekday trips. Accordingly, the net change in the trip generation potential of the site after the proposed rezone is projected to increase by 44 AM peak hour trips, 67 PM peak hour trips, and 1,134 average weekday trips.
3. No significant trends or crash patterns were identified at the study intersections that are indicative of safety concerns. Accordingly, no safety mitigation is recommended per the crash data analysis.
4. Adequate intersection sight distances are available at the site access approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue to allow for safe and efficient operation of the intersection. No mitigation is necessary or recommended at the intersection with respect to intersection sight distance.
5. Left turn lane warrants are projected to be met at the eastbound approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue under year 2026 conditions with the proposed zone change implemented. To accommodate this left-turn lane the existing median on the west intersection leg can be re-striped accordingly. Left-turn lane warrants are not projected to be met at any of the other study intersections. No other new left-turn lanes are necessary or recommended at these study intersections.
6. Traffic signal warrants are not projected to be met at the unsignalized study intersections under year 2031 conditions with the zone change implemented. Therefore, no new traffic signals are necessary or recommended as part of the proposed comprehensive plan/zone map change application.
7. All study intersections are currently operating acceptably per City of Vancouver standards and are projected to continue operating acceptably through year 2031, approximately five years beyond an assumed buildout year of the site following approval of the proposed zone change. Accordingly, no operational mitigation is necessary or recommended at the study intersections.

# Project Description

## Introduction

The proposed Wood Duck Springs Comprehensive Plan Amendment/Zone Change project will include the rezone of six properties located at/near 8208 NE 63<sup>rd</sup> Street in Vancouver, Washington. The proposal will rezone the properties from Urban Low Density (R-9) to Urban High Density (R-22) and Community Commercial (CC), where approximately one acre will be allocated to the CC zone. Future access to the site will likely be provided via a future north leg at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue.

Based on correspondence with City of Vancouver staff, the report conducts safety and capacity/level of service analyses at the following intersections:

1. NE 63<sup>rd</sup> Street at NE Andresen Road
2. NE 63<sup>rd</sup> Street at NE 72<sup>nd</sup> Avenue
3. NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue (Site Access)
4. NE 58<sup>th</sup> Street at NE 81<sup>st</sup> Avenue
5. NE 58<sup>th</sup> Street at NE 82<sup>nd</sup> Avenue

The purpose of this study is to determine whether the transportation system within the vicinity of the site is capable of safely and efficiently supporting existing uses and potential on-site development following approval of the zone change, and to determine any mitigation that may be necessary to do so. Detailed information on traffic counts, trip generation calculations, safety analyses, and level of service calculations is included in the appendix to this report.

## Location Description

The project site is located north of NE 63<sup>rd</sup> Street, east of NE 78<sup>th</sup> Avenue and west of NE 84<sup>th</sup> Place in Vancouver, Washington. The subject site consists of six properties (assessor parcels 105241000, 105242000, 105190005, 105190010, 105190000, and 986042813) which encompass an approximate total of 13.8 acres. The site is located within a predominately residential area of the City, with a mix of residential uses and undeveloped land surrounding the site in all directions. One notable development near the project site is Vancouver Mall, located approximately a half mile to the south of the site.

Figure 1 presents an aerial image of the nearby vicinity with the project site outlined in yellow.

Figure 1: Aerial Photo of Site Vicinity (Image from Google Earth)

#### Vicinity Streets

The study intersections are composed of six roadways. Table 1 provides a description of these vicinity roadways.

Table 1: Vicinity Roadway Descriptions

Street Name	Jurisdiction	Functional Classification	Speed (MPH)	On-Street Parking	Curbs & Sidewalks	Bicycle Lanes
NE 63rd Street	Vancouver/Clark County	Collector/Minor Arterial	35/40	Not Permitted	Partial Both Sides	Both Sides
NE 58th Street	Vancouver/Clark County	Collector Arterial	25/30	Partially Permitted	Partial Both Sides	None
NE Andresen Road	Vancouver	Principal Arterial	40	Not Permitted	Both Sides	Partial Both Sides
NE 72nd Avenue	Vancouver	Collector Arterial	30	Partially Permitted	Partial Both Sides	Partial Both Sides
NE 81st Avenue	Vancouver	Collector Arterial	25	Permitted	Both Sides	None
NE 82nd Avenue	Vancouver	Collector/Minor Arterial	25	Partially Permitted	Both Sides	Partial Both Sides

Table Notes: Functional classification based on Vancouver Arterial Street System and Classification map.

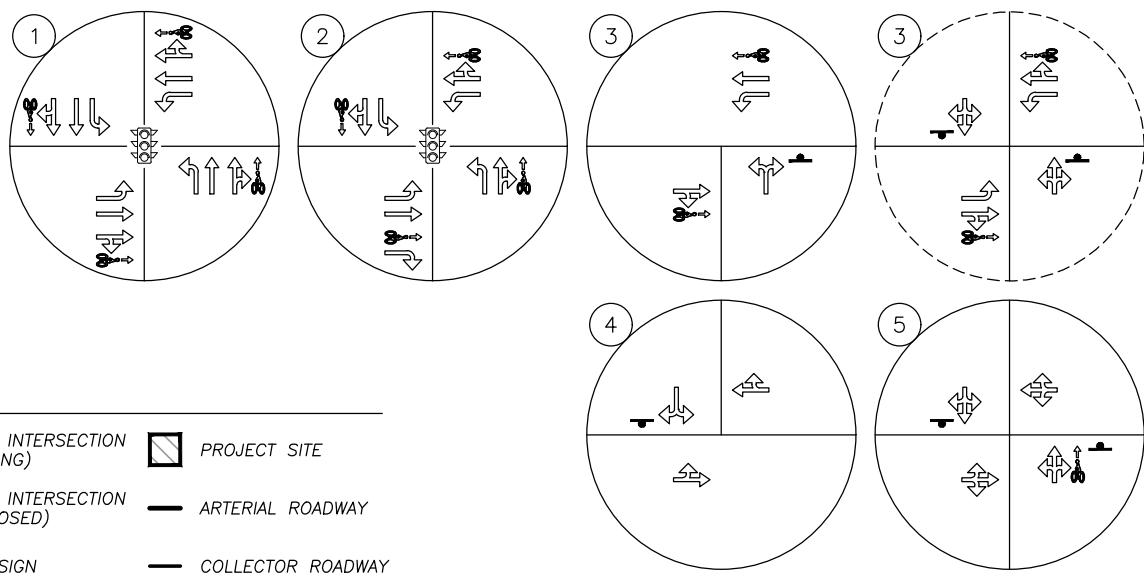

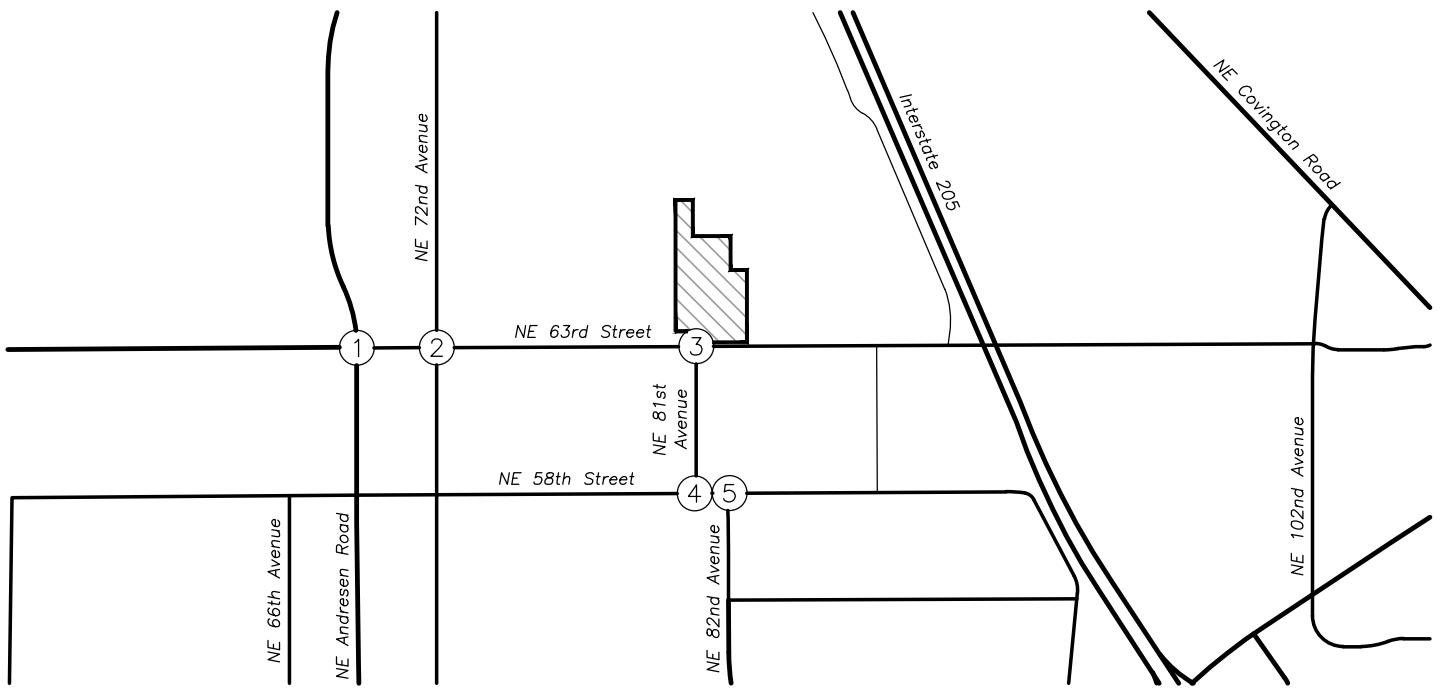

## Study Intersections

At the request of the City of Vancouver, an analysis of five nearby intersections is required as part of the zone change analysis. A summarized description of these study intersections is provided in Table 2.

Table 2: Study Intersection Description

Number	Intersection	Geometry	Traffic Control	Phasing/Stopped Approaches
1	NE 63rd Street at NE Andresen Road	Four-Legged	Traffic Signal	Protected NB/SB/EB/WB Left-turns, Overlap EB Right turn
2	NE 63rd Street at NE 72nd Avenue	Four-Legged	Traffic Signal	Permitted NB/SB Left-turns, Permitted/Protected EB/WB Left-turns
3	NE 63rd Street at NE 81st Avenue	Three-Legged	Stop-Controlled	Stop-Controlled NB Approach
4	NE 58th Street at NE 81st Avenue	Three-Legged	Stop-Controlled	Stop-Controlled SB Approach
5	NE 58th Street at NE 82nd Avenue	Four-Legged	Stop-Controlled	Stop-Controlled NB/SB Approaches

A vicinity map showing the project site, vicinity streets, and study intersection configuration are shown in Figure 2.

## Site Trips

### Trip Generation

The subject site is currently zoned as R-9 and is proposed for a change in zoning to R-22 and CC, where approximately one acre will be allocated to the CC zone. To determine the potential impacts of the proposed zone change, reasonable “worst-case” development scenarios for the existing and proposed zones were determined utilizing data for the most traffic-intensive uses permitted within each zone.

#### Existing R-9 Zoning

To determine a reasonable “worst-case” development scenario under the existing R-9 zone, Vancouver Municipal Code (VMC) section 20.410 *Commercial and Mixed-Use Districts* was referenced and compared to a variety of land uses provided within the *Trip Generation Manual*<sup>1</sup>. Based on an assessment of permitted uses under the R-9 zone, data from land use code 210, *Single-Family Detached Housing*, was used to estimate the existing trip generation potential of the site based on number of dwelling units. Note the City of Vancouver utilizes alternative trip generation rates for land use code 210 which slightly vary from the 11<sup>th</sup> Edition of the *Trip Generation Manual*.

To determine a reasonable maximum dwelling unit count that could be developed within the site, the maximum unit per net acre density rate was referenced from VMC 20.410.040, where an R-9 zone has a maximum 8.7 units per net acre of developable space. To determine a net acre area of developable space on the site, it is assumed that a reasonable, if not conservative, 20% reduction in site buildable area will be necessary to accommodate streets/right-of-way improvements, public space, etc. The project site encompasses approximately 13.8 acres. Based on correspondence with the applicant’s team approximately 12.0 net developable acres was considered for analysis, resulting in a reasonable “worst-case” development scenario of up to 105 single-family houses.

#### Proposed R-22 and CC Zoning

To determine a reasonable “worst-case” development scenario under the proposed R-22 and CC zones, VMC sections 20.420 *Higher Density Residential Districts* and 20.430 *Commercial and Mixed Use Districts* were referenced. Based on an assessment of permitted uses under the R-22 and CC zones and evaluating what could reasonably be developed on-site, data from the following land use codes were used to estimate the proposed trip generation potential of the site:

- 220, *Multifamily Housing (Low-Rise)*, based on number of dwelling units.
- 492, *Health/Fitness Club*, based on the square footage of the gross building floor area.

To determine a dwelling unit count within the proposed R-22 zone, the maximum unit per acre density rate from City code was referenced from VMC 20.420.040, where an R-22 zone allows for a maximum 22 units per acre of developable space. For the CC zone and referring to VMC 20.430.040, no specific minimum floor-to-area (FAR) ratio or building coverage standards are provided. The R-22 zone will encompass approximately 12.86 acres while the remaining site area will be applied to the CC zone. Based on these assumptions the

---

<sup>1</sup> Institute of Transportation Engineers (ITE), *Trip Generation Manual*, 11<sup>th</sup> Edition, 2021.

reasonable “worst-case” development scenario may include the development of up to 283 multifamily dwellings and an approximate 8,000 square foot gym/fitness center.

### Analysis Results

The trip generation calculations show that under the existing R-9 zone, the subject site could reasonably generate up to 79 AM peak hour trips, 105 PM peak hour trips, and 1,050 average weekday trips. Under the proposed R-22 and CC zones, the site could reasonably generate up to 123 AM peak hour trips, 172 PM peak hour trips, and 2,184 average weekday trips. Accordingly, the net change in the trip generation potential of the site after the proposed rezone is projected to increase by 44 AM peak hour trips, 67 PM peak hour trips, and 1,134 average weekday trips.

The trip generation estimates are summarized in Table 3. Detailed trip generation calculations are included in the technical appendix.

**Table 3: Proposed Zone Change Trip Generation Summary**

ITE Code	Size	AM Peak Hour			PM Peak Hour			Weekday Total	
		Enter	Exit	Total	Enter	Exit	Total		
<i><b>Existing R-9 Zone</b></i>									
Single-Family Detached Housing	210	105 units	20	59	79	66	39	105	1,050
<i><b>Proposed R-22 and CC Zones</b></i>									
Multifamily Housing (Low-Rise)	220	283 units	27	86	113	91	53	144	1,908
Health/Fitness Club	492	8,000 SF	5	5	10	16	12	28	276

<i><b>Net Change In Site Trip Generation Potential</b></i>									
Net Increase			12	32	44	41	26	67	1,134

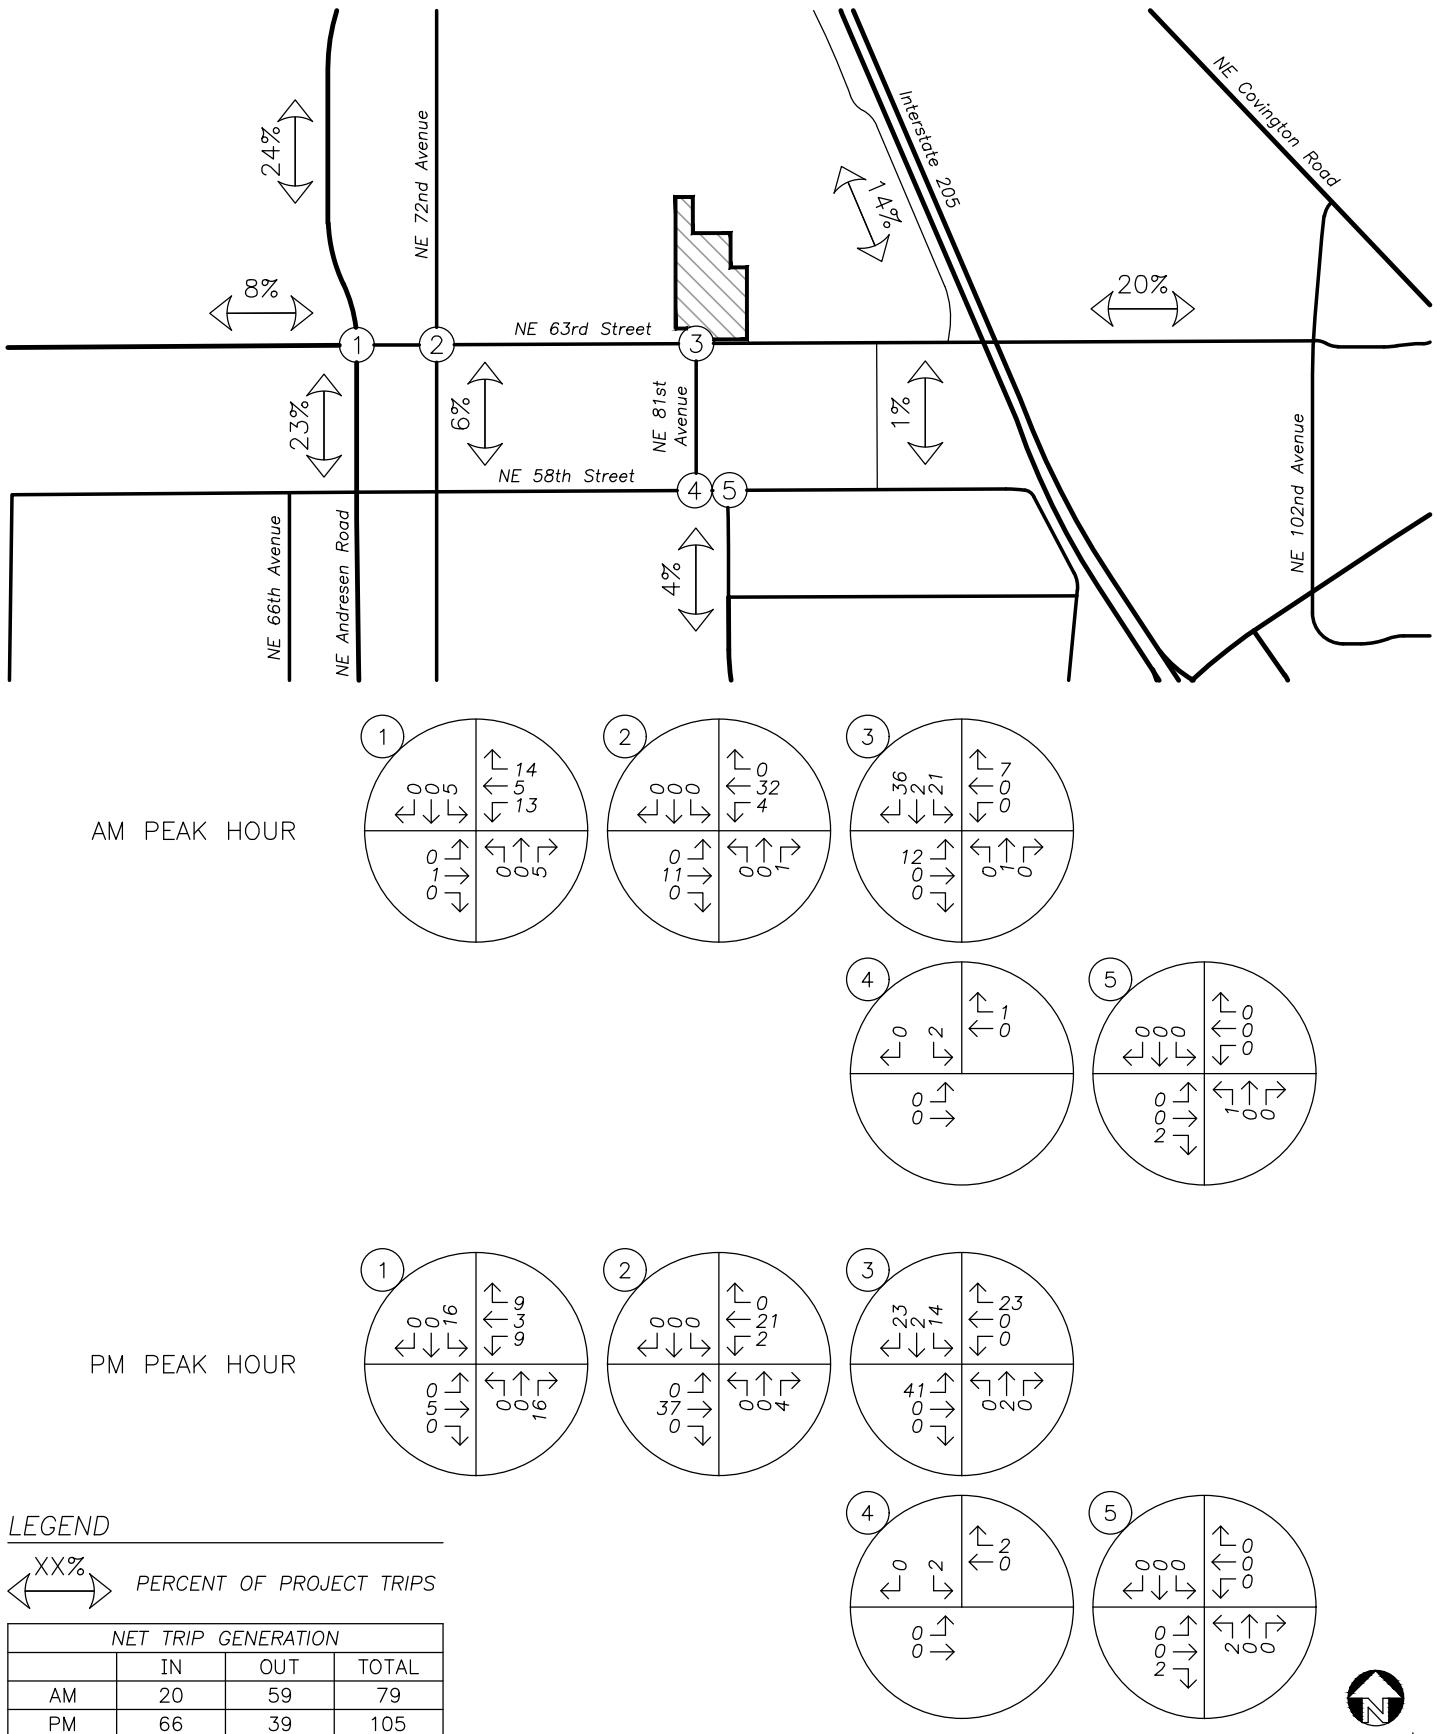

### Trip Distribution

The trip distribution for the project site was derived using the Southwest Washington Regional Transportation Council (RTC) transportation system model. The project site is located in Transportation Analysis Zone (TAZ) #1861, for which a select zone analysis was run to determine the distribution of site trips entering and exiting the zone.

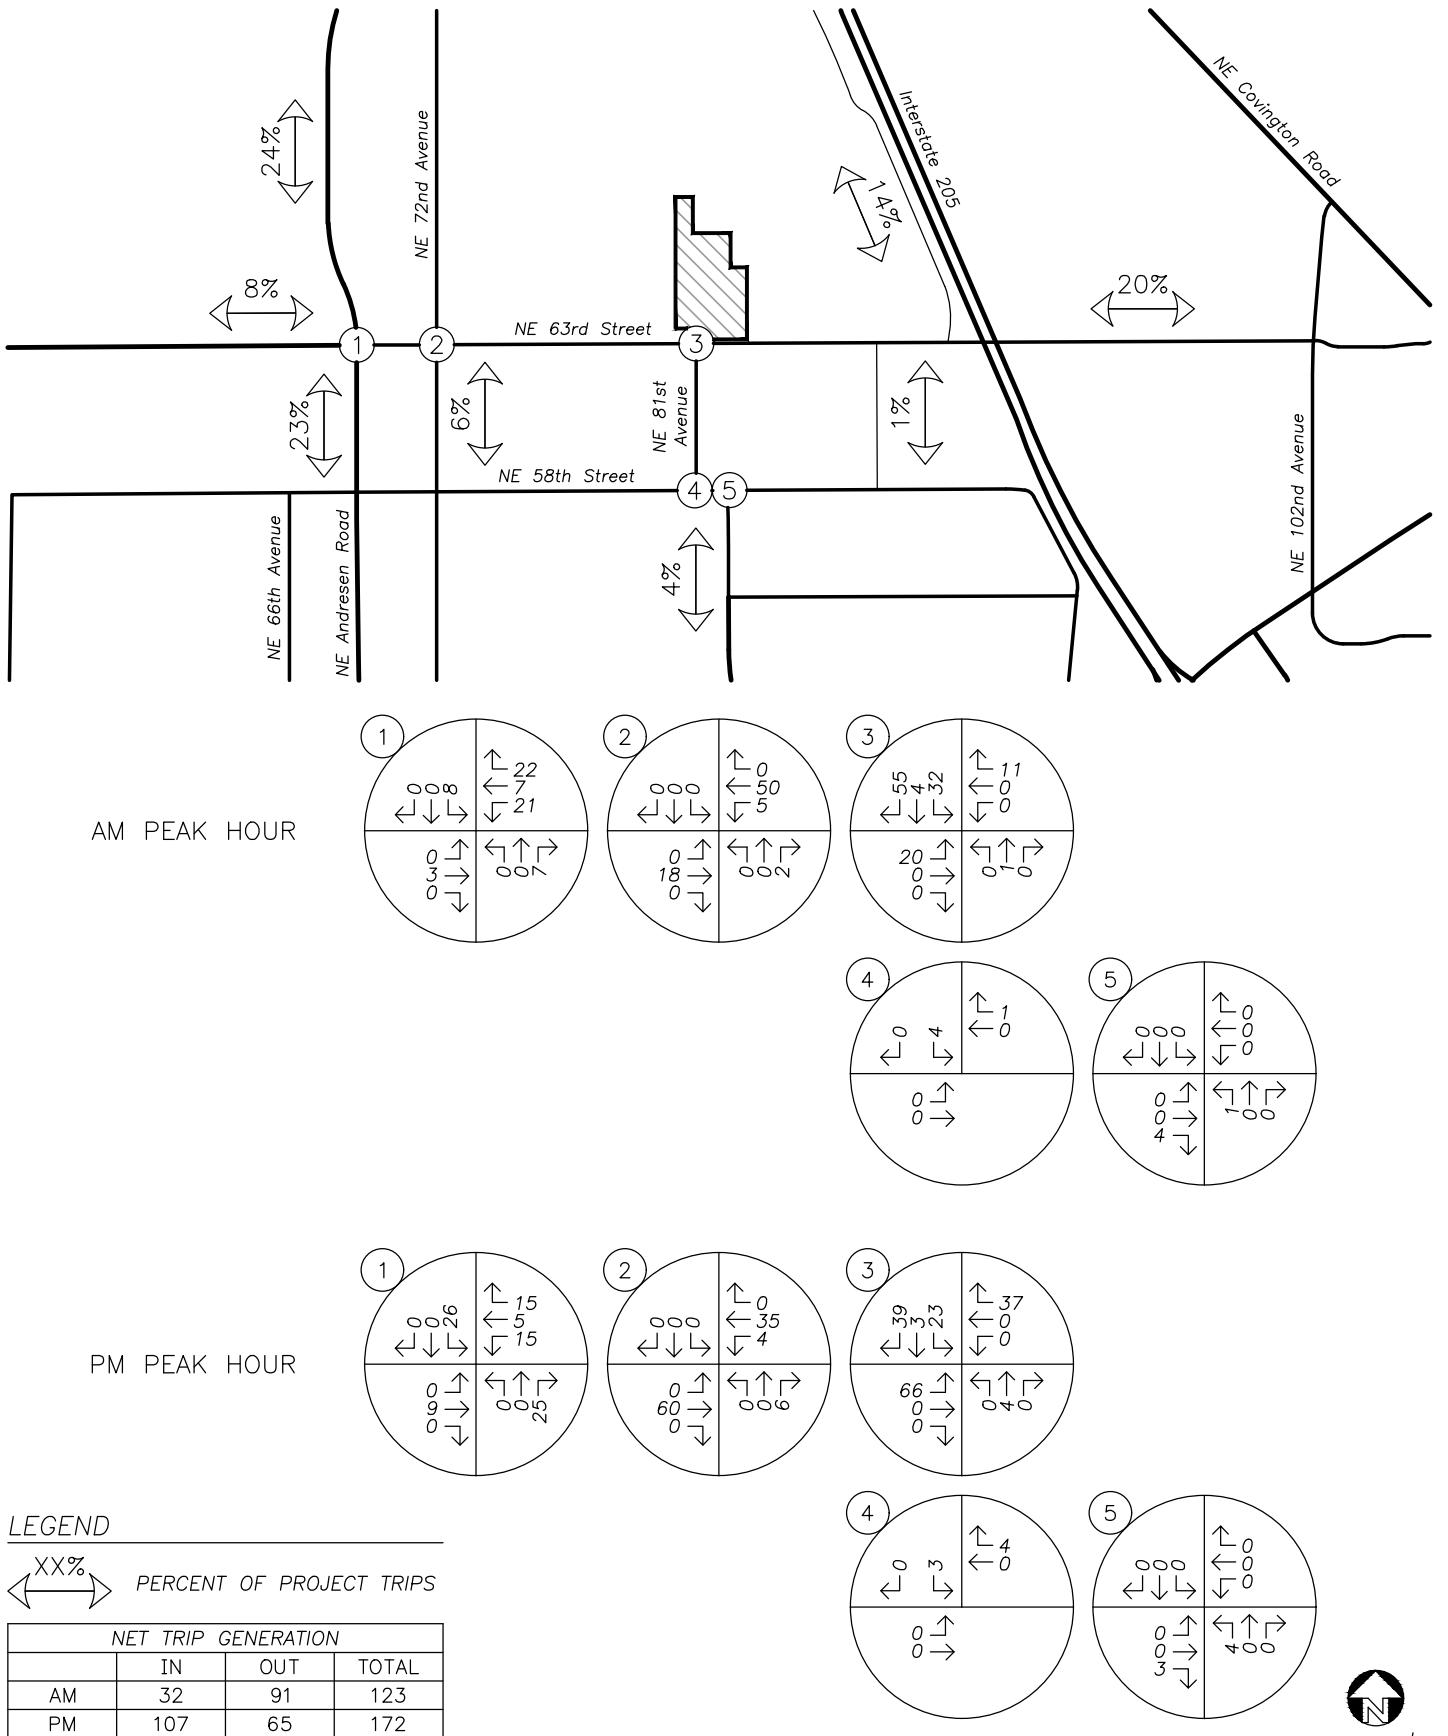

Using information from the RTC model, the following trip distribution is projected within the immediate site vicinity:

- Approximately 24% of site trips will travel to/from the north along NE Andresen Road, north of NE 63<sup>rd</sup> Street.
- Approximately 23% of site trips will travel to/from the south along NE Andresen Road, south of NE 63<sup>rd</sup> Street.
- Approximately 20% of site trips will travel to/from the east along NE 63<sup>rd</sup> Street, east of NE Meadows Drive.
- Approximately 14% of site trips will travel to/from the north along NE Meadows Drive, north of NE 63<sup>rd</sup> Street.
- Approximately 8% of site trips will travel to/from the west along NE 63<sup>rd</sup> Street, west of NE Andresen Road.
- Approximately 6% of site trips will travel to/from the south along NE 72<sup>nd</sup> Avenue, south of NE 63<sup>rd</sup> Street.
- Approximately 4% of site trips will travel to/from the south along NE 81<sup>st</sup> Avenue, south of NE 63<sup>rd</sup> Street.
- Approximately 1% of site trips will travel to/from the south along NE 87<sup>th</sup> Avenue, south of NE 63<sup>rd</sup> Street.

The trip distribution and assignment for the site trips generated during the AM and PM peak hours are shown in Figure 3 and Figure 4 for the existing and proposed zone scenarios, respectively.

**SITE TRIP DISTRIBUTION & ASSIGNMENT**  
Existing R-9 Zone - Potential Site Trips  
AM & PM Peak Hours

## SITE TRIP DISTRIBUTION & ASSIGNMENT

Proposed R-22 & CC Zones - Potential Site Trips  
AM & PM Peak Hours

## Traffic Volumes

### 2023 Existing Conditions

Traffic counts were conducted at the study intersections on Thursday, September 21, 2023, from 7:00 AM to 9:00 AM and from 4:00 PM to 6:00 PM. Data was used from each intersection's respective AM and PM peak hours.

Figure 4 shows the year 2023 existing traffic volumes at the study intersections during the AM and PM peak hours.

### 2026 Background Conditions

#### Volume Growth

To provide an analysis of the potential impact of the proposed zone change on the nearby transportation facilities, an estimate of future traffic volumes is required. In order to approximate the future year 2026 traffic volumes at the study intersections, the estimated year of when the project site may redevelop as a higher intensive trip generating use, a compounded growth rate of 1.5% per year was applied to the 2023 existing traffic volumes in accordance with the City of Vancouver's Traffic Study Guidelines, dated September 2021. The growth rate was applied to the existing counts over a three-year period, assuming a 2026 site buildout year.

#### In-Process Data

In addition to the traffic volume growth described above, there are several in-process developments that are currently approved/proposed for construction within the site vicinity that are expected to impact nearby study intersections. These in-process developments include the following:

1. Park Meadow Subdivision
2. 66<sup>th</sup> Avenue Cottages
3. NE 62<sup>nd</sup> Street Apartments
4. NE 63<sup>rd</sup> Street Storage Facility
5. NE 63<sup>rd</sup> Street Infill Subdivision
6. Velendo Industrial Park

The in-process developments are not currently/fully contributing trips to the transportation system but may potentially be by the assumed 2026 buildout year of the site. Additional trips corresponding to each in-process development were added to the existing year traffic volumes in addition to the three years of traffic growth at each of the applicable study intersections. To maintain a conservative analysis of operation at the study intersections, all in-process developments were assumed to be constructed by year 2026. Figure A in the technical appendix shows the in-process development trips at the study intersections during the AM and PM peak hours.

Figure 5 shows the projected year 2026 background traffic volumes at the study intersections during the AM and PM peak hours.

## 2026 Background Conditions with Zone Change

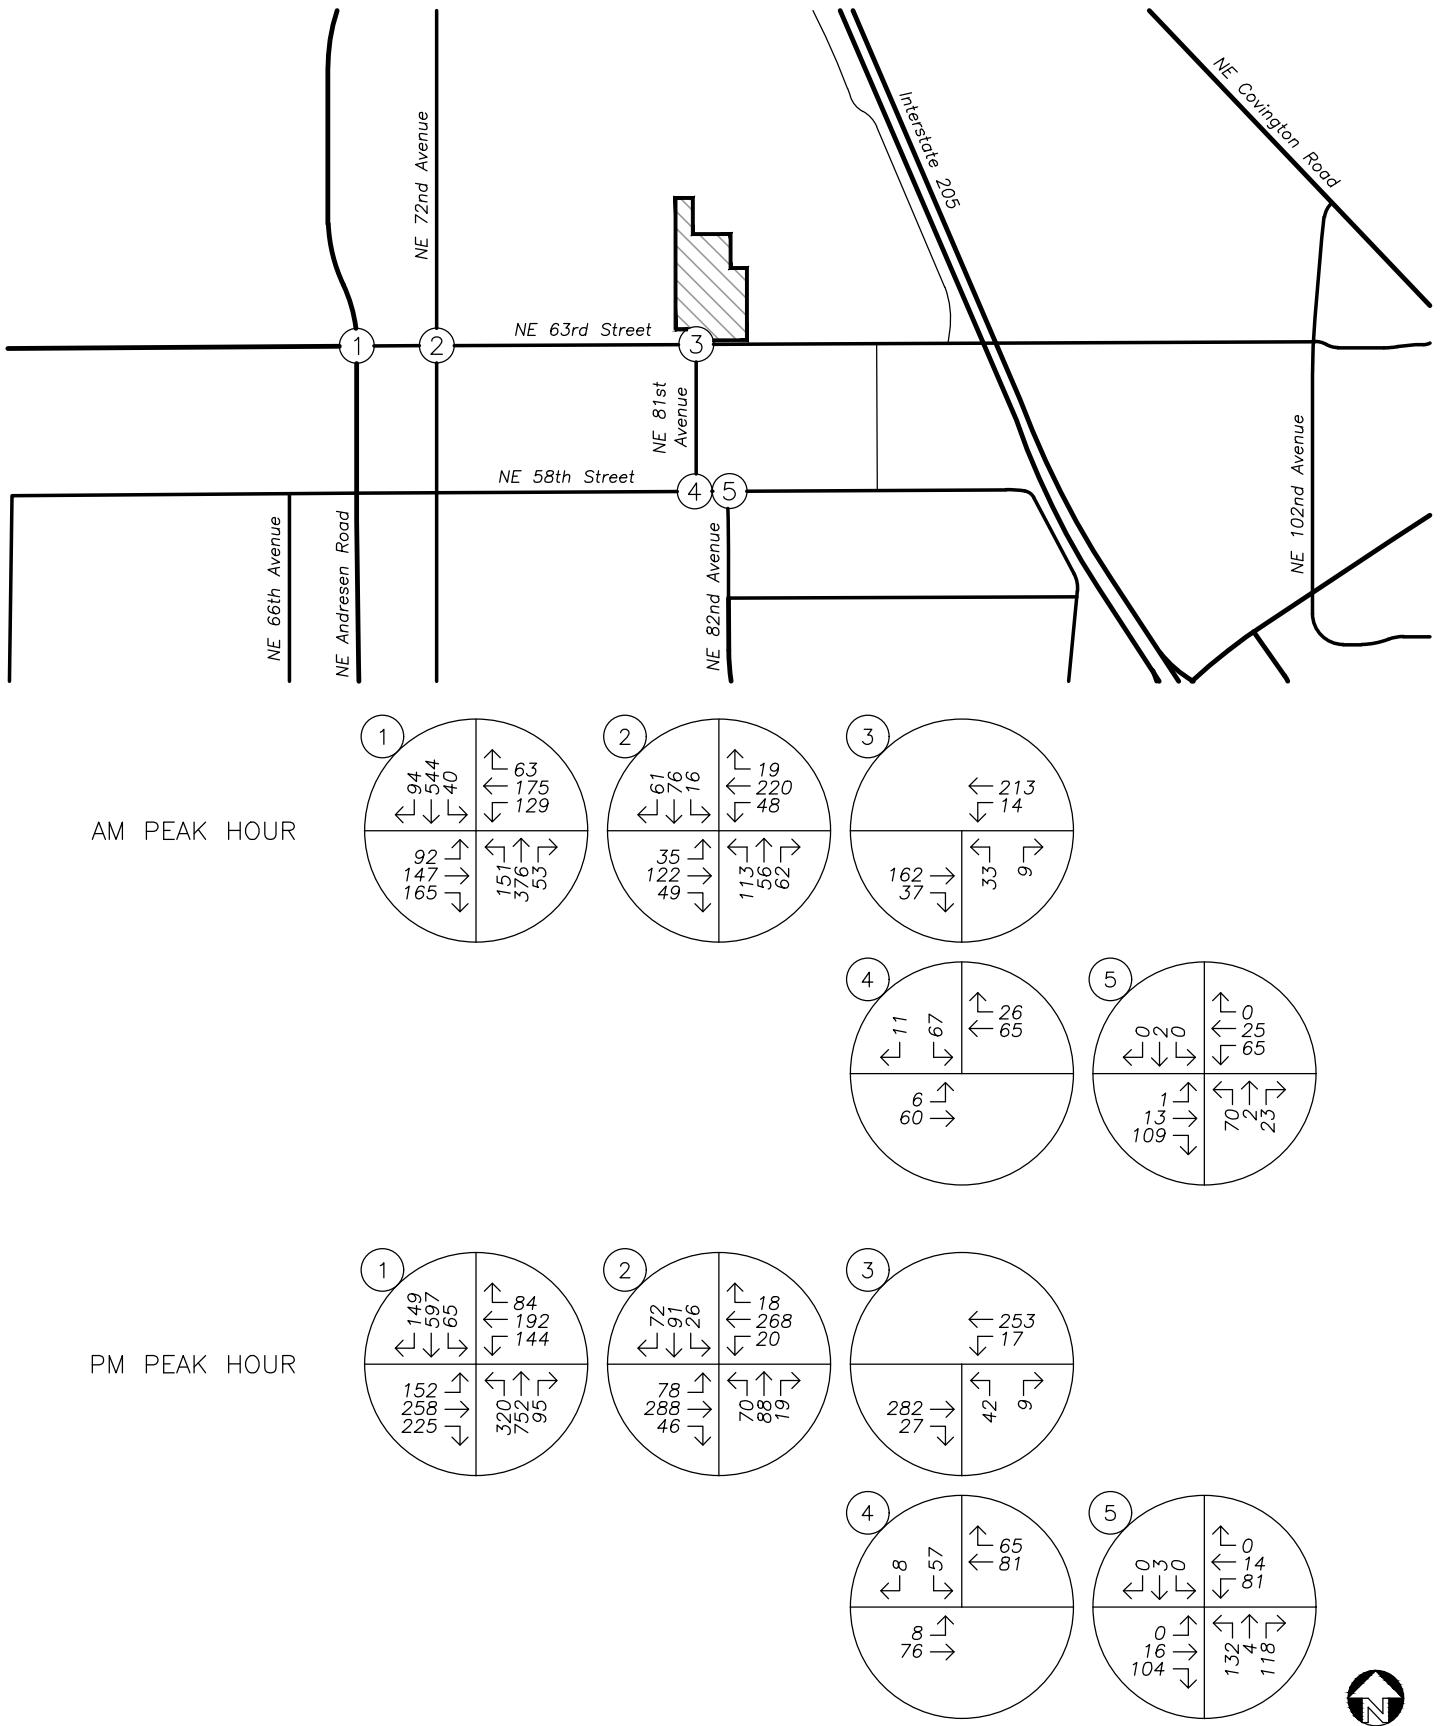

The net change in peak hour trips calculated to be potentially generated as a result of the proposed zone change, as described earlier within the *Site Trips* section, were added to the projected year 2026 background traffic volumes to obtain the expected year 2026 site buildout volumes.

Figure 7 and Figure 8 show the year 2026 background traffic volumes at the study intersections under the existing and proposed zones, respectively, during the AM and PM peak hours.

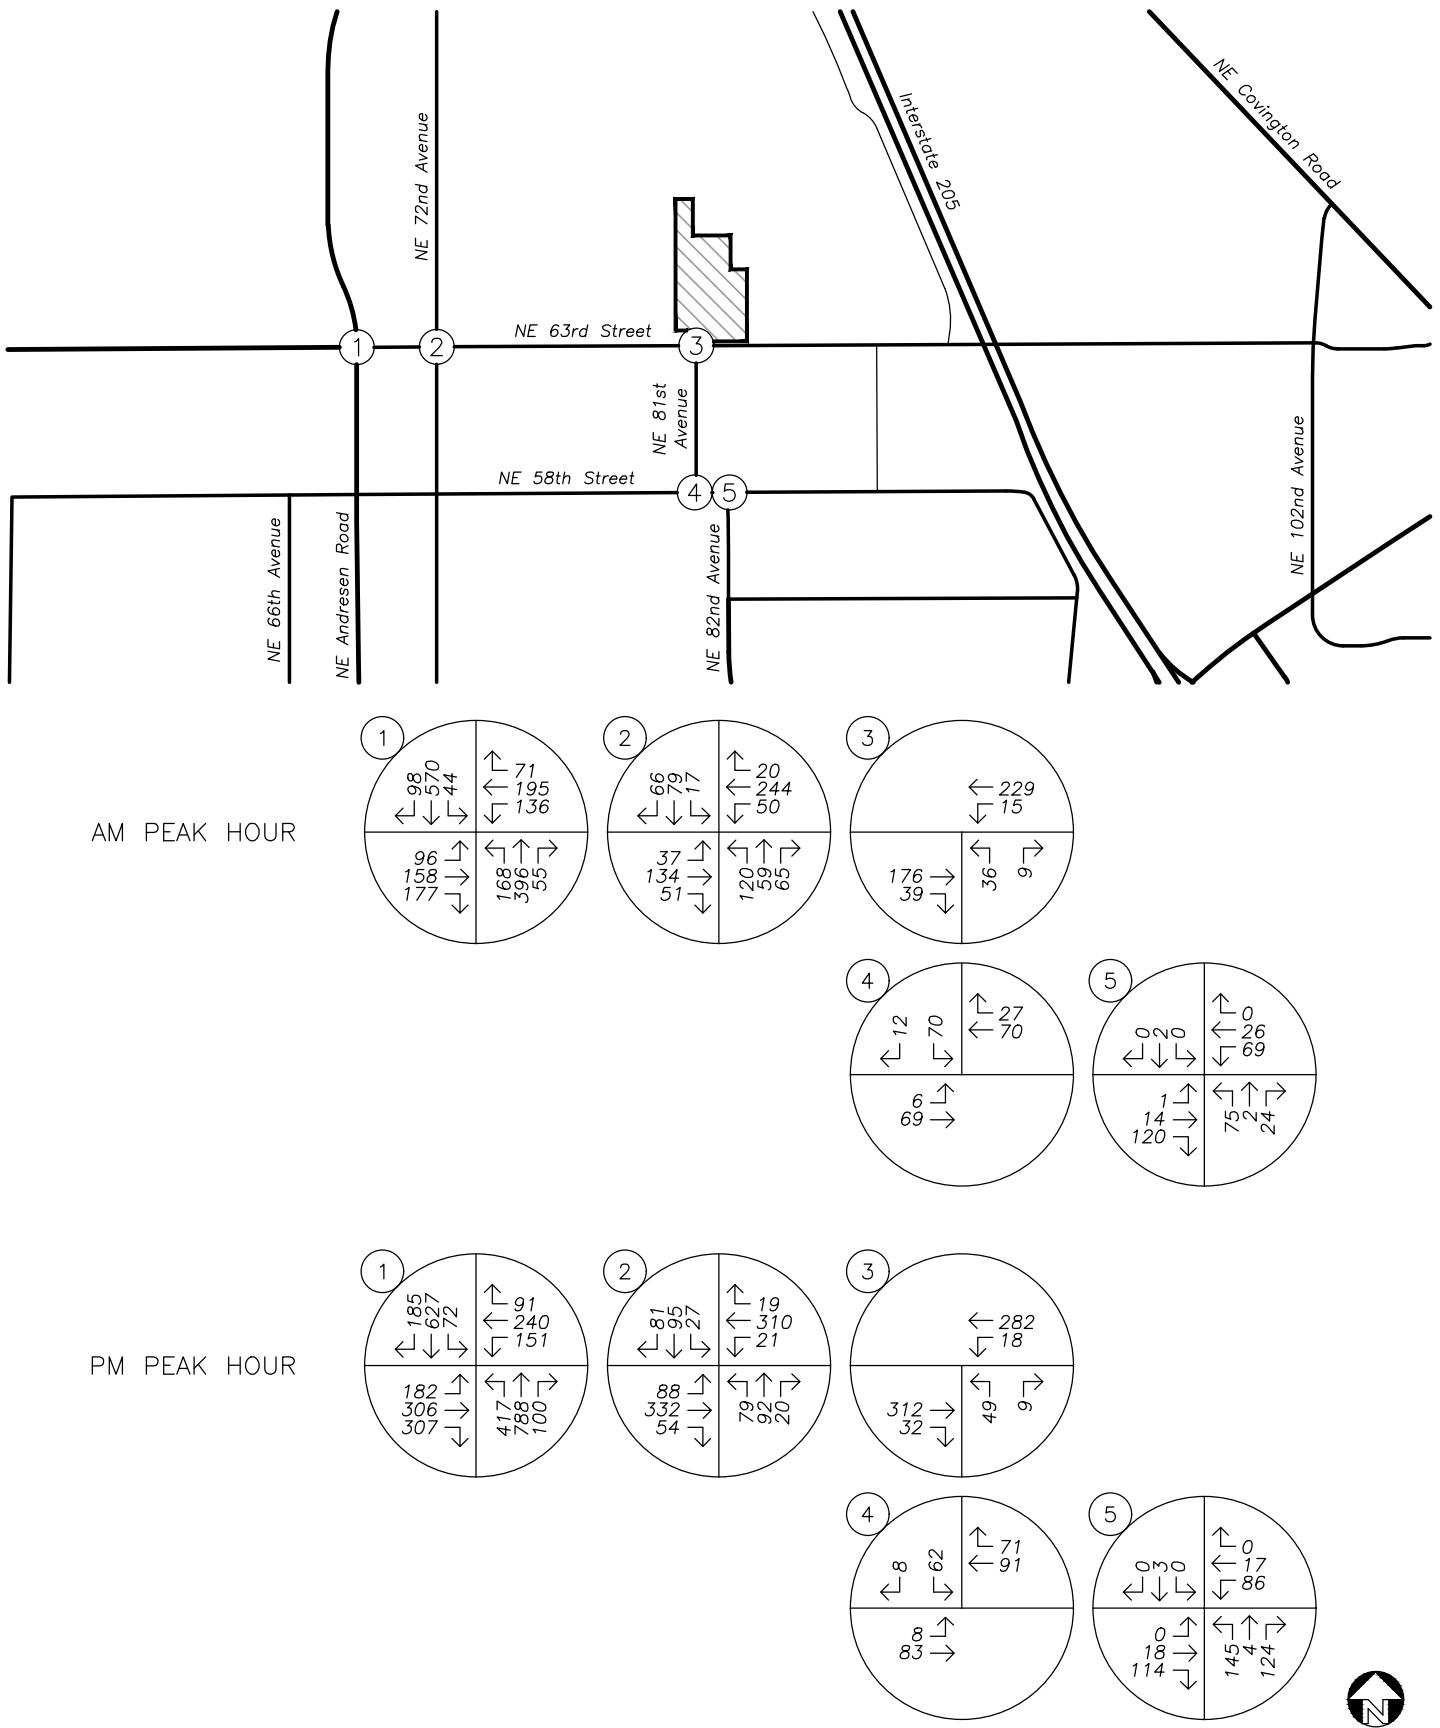

## 2031 Future Conditions with Zone Change

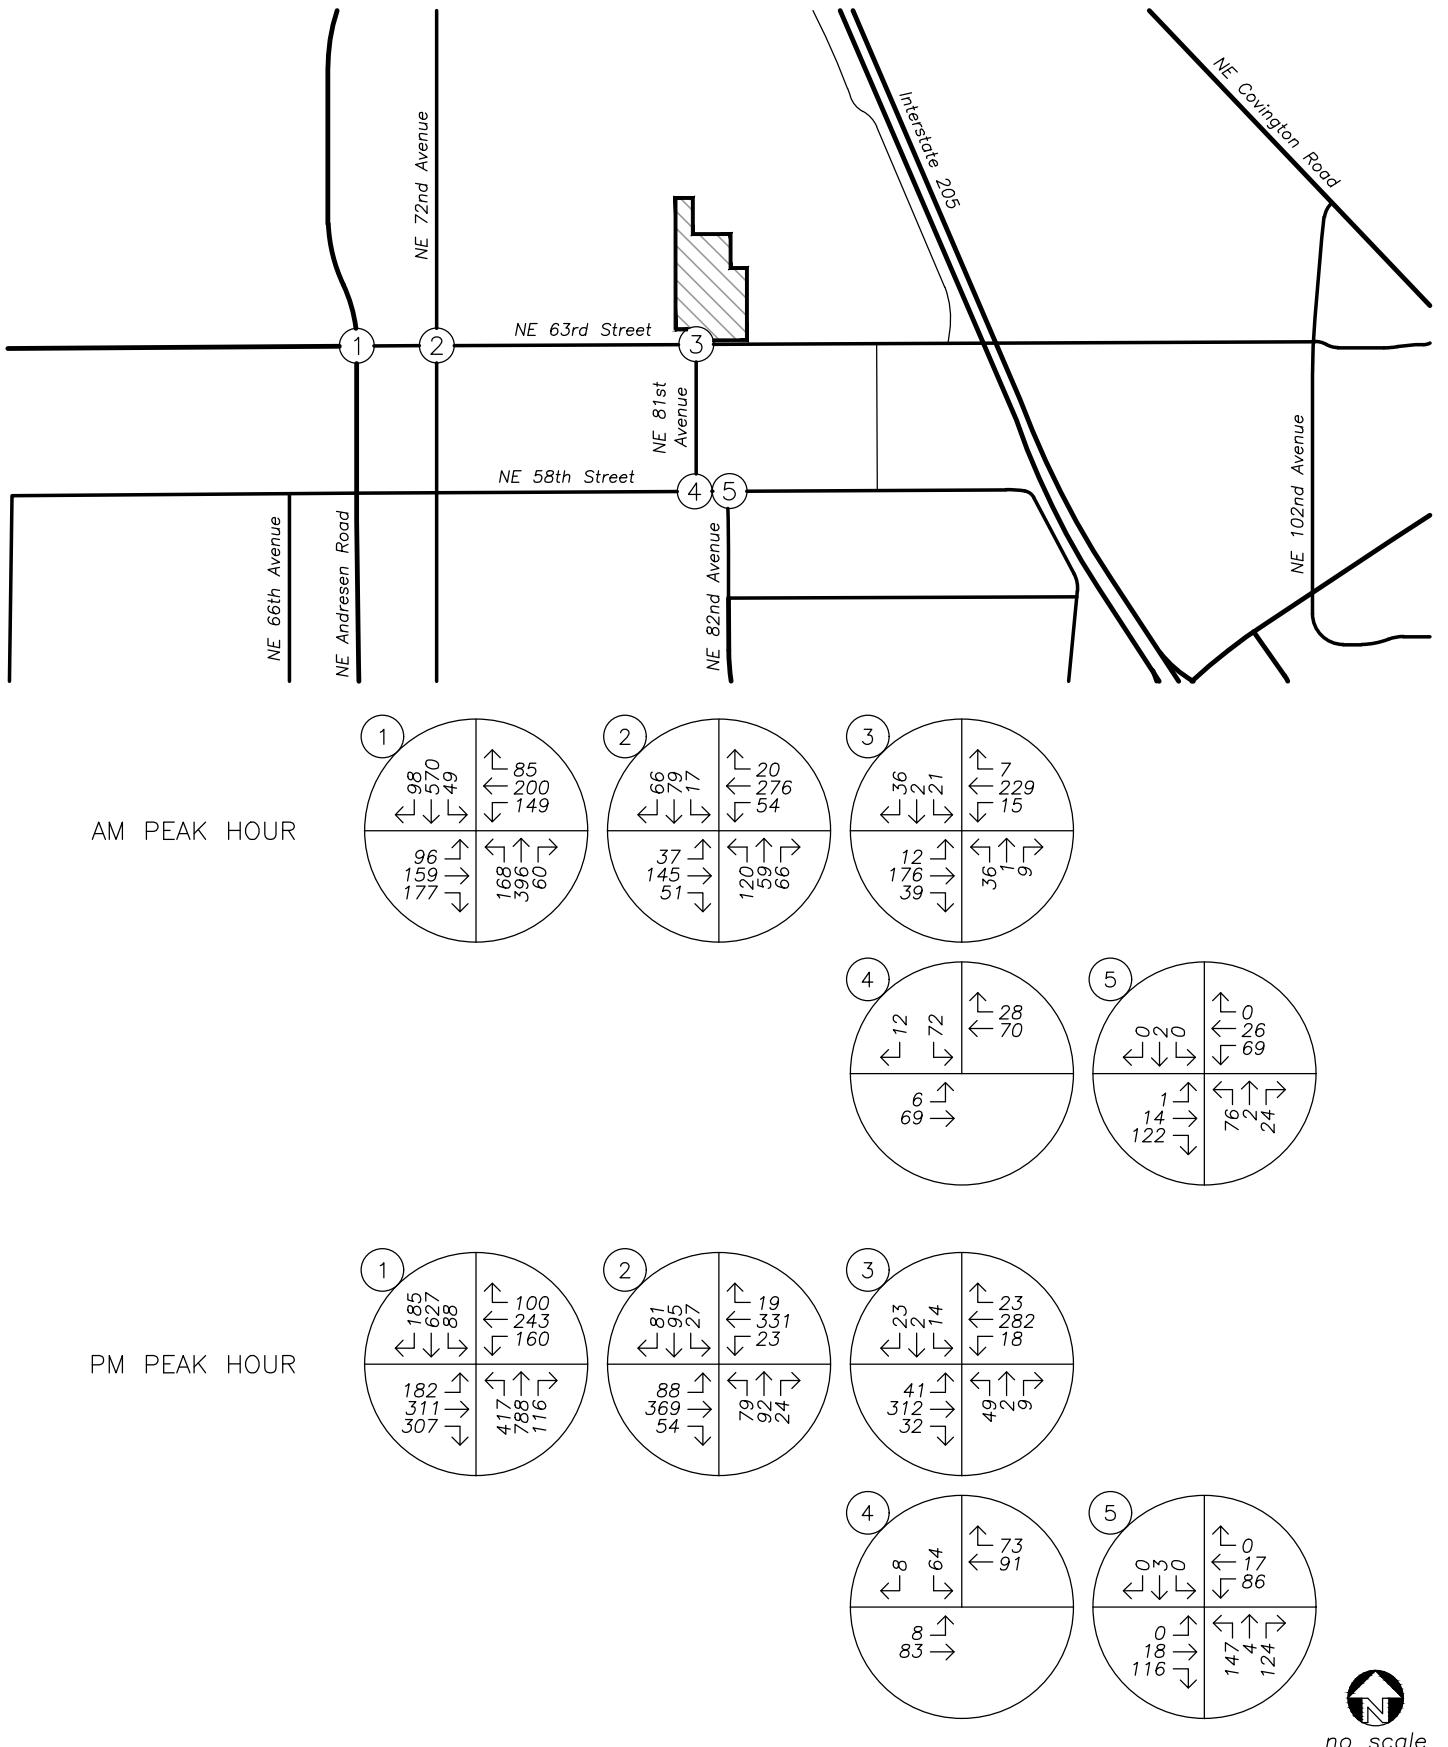

Per the City of Vancouver's Traffic Study Guidelines, an additional future year analysis scenario was prepared which reviews traffic conditions five years beyond the assumed 2026 buildout year of the site. The traffic volumes were estimated in a manner consistent with the methodologies discussed in the aforementioned sections, with the exception that growth rates were applied to the existing year traffic volumes over an eight-year period to estimate 2031 traffic conditions.

Figure 9 and Figure 10 show the year 2031 future traffic volumes at the study intersections under the existing and proposed zones, respectively, during the AM and PM peak hours.

## Safety Analysis

### Crash History Review

Using data obtained from the Washington Department of Transportation (WSDOT) Crash Data and Reporting Branch, a review of the most recent available five years of crash history (January 2018 to December 2022) at the study intersections was performed. The crash data was evaluated based on the number of crashes, the type of collisions, the severity of the collisions, and the resulting crash rate for the intersection.

Crash rates provide the ability to compare safety risks at different intersections by accounting for both the number of crashes that have occurred during the study period and the number of vehicles that typically travel through the intersection. Crash rates were calculated using the common assumption that traffic counted during the PM peak hour represents approximately 10% of the annual average daily traffic (AADT) at the intersection. Crash rates in excess of 1.00 crashes per million entering vehicles (CMEV) may be indicative of design deficiencies and therefore require a need for further investigation and possible mitigation.

With regard to crash severity, WSDOT classifies crashes in the following categories:

- *No Apparent Injury* (NA);
- *Possible Injury* (P);
- *Suspected Minor Injury* (SM);
- *Suspected Serious Injury* (SS); and
- *Fatality or Fatal Injury*.

Table 4 provides a summary of crash types while Table 5 summarizes crash severities and rates for the study intersections. Crash data is included in the technical appendix to this report.

Table 4: Crash Type Summary

Number	Intersection	Crash Type							Total
		Rear End	Turn	Angle	Fixed Object	Side swipe	Ped/ Bike	Other	
1	NE 63rd Street at NE Andresen Road	11	1	5	0	0	1	0	18
2	NE 63rd Street at NE 72nd Avenue	3	6	3	1	1	1	0	15
3	NE 63rd Street at NE 81st Avenue	0	0	0	0	0	0	0	0
4	NE 58th Street at NE 81st Avenue	0	0	0	1	0	0	1	2
5	NE 58th Street at NE 82nd Avenue	0	0	0	0	0	0	0	0

Table 5: Crash Severity and Rate Summary

Number	Intersection	Crash Severity					Total Crashes	AADT	Crash Rate
		NA	P	SM	SS	Fatal			
1	NE 63rd Street at NE Andresen Road	13	2	2	1	0	18	30,330	0.33
2	NE 63rd Street at NE 72nd Avenue	10	2	3	0	0	15	10,840	0.76
3	NE 63rd Street at NE 81st Avenue	0	0	0	0	0	0	6,300	0.00
4	NE 58th Street at NE 81st Avenue	2	0	0	0	0	2	2,950	0.37
5	NE 58th Street at NE 82nd Avenue	0	0	0	0	0	0	4,720	0.00

Table Notes: **BOLDED** text indicates a crash rate in excess of 1.00 CMEV.

Per Tables 4 and 5, three of the reported crashes at the study intersections involved a pedestrian/bicyclist or were classified as *Suspected Serious Injury*. The following provides a summary description of these crashes in more detail.

#### NE 63<sup>rd</sup> Street at NE Andresen Road

Two of the reported crashes at the intersection involved a pedestrian or were classified as *Suspected Serious Injury*.

The pedestrian-related crash occurred when the driver of a southbound truck struck a pedestrian who was crossing at the intersection. The crash was coded as indicating the pedestrian failed to yield right-of-way to the traveling vehicle. The crash was classified as *Suspected Minor Injury* where one person involved in the crash sustained injury.

The crash that was classified as *Suspected Serious Injury* occurred when the driver of a southbound passenger car rear-ended another southbound passenger car. The driver who instigated the collision was exceeding a reasonable safe travel speed, noting that roadway conditions were likely slick due to snow/slush. Two people involved in the collision sustained injuries.

#### NE 63<sup>rd</sup> Street at NE 72<sup>nd</sup> Avenue

One of the reported crashes at the intersection involved a pedestrian. The crash occurred when the driver of a westbound left-turning passenger car was inattentive and failed to yield right-of-way to a pedestrian who was crossing at the intersection. The crash was classified as *Suspected Minor Injury* where one person involved in the crash sustained injury.

#### Analysis Summary

Based on a review of available crash data, no significant trends or crash patterns were identified at the study intersections that are indicative of safety concerns. Accordingly, no safety mitigation is recommended per the crash data analysis.

# Sight Distance Evaluation

## Methodology

Sight distances were evaluated at the future planned north leg at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue. The minimum required intersection sight distance was determined in accordance with the City of Vancouver's Municipal Code Section 11.80.140. These standards state that intersection sight distance measurements must comply with standards established in *A Policy on Geometric Design of Highways and Streets*<sup>2</sup>. According to AASHTO, the driver's eye is assumed to be approximately 15 feet (14.5 feet specifically) from the near edge of the nearest travel lane (or traveled way) of the intersecting street and at a height of 3.5 feet above the minor-street approach pavement. The vehicle driver's eye-height along the major-street approach is assumed to be 3.5 feet above the cross-street pavement.

Per the AASHTO manual, intersection sight distance is an operation measure intended to provide sufficient line of sight along the major-street so that a driver could turn from the minor-street approach without impeding traffic flow. Conversely, stopping sight distance is considered the minimum requirement to ensure safe operation of an intersection. This is the distance that allows an oncoming driver to see a hazard on the roadway, react, and come to a complete stop, if necessary, to avoid a collision.

## Field Measurements

Based on a posted speed of 35 mph along NE 63<sup>rd</sup> Street, the minimum recommended intersection sight distances to allow for safe and efficient operation of the intersection is 415 feet to the west for southbound left-turning vehicles (when considering the need to cross one additional travel lane) and 335 feet to the east for southbound right-turning vehicles. In both directions, sight distances were measured to be in excess of 450 feet.

## Analysis Findings

Based on the analysis, adequate intersection sight distances are available at the site access approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue to allow for safe and efficient operation of the intersection. No mitigation is necessary or recommended at the intersection with respect to intersection sight distance.

---

<sup>2</sup> American Association of State Highway and Transportation Officials (AASHTO), *A Policy on Geometric Design of Highways and Streets*, 7th Edition, 2018.

## Warrants Analysis

Left-turn lane and preliminary traffic signal warrants were examined for the study intersections where such treatments would be applicable.

### Left-Turn Lane Warrants

A left-turn refuge lane is primarily a safety consideration for the major-street of unsignalized, minor-street stop-controlled intersections, removing left-turning vehicles from the through traffic stream. Two methods for evaluating left-turn lane warrants were utilized:

- Left-turn lane warrants developed by the Transportation Research Board (TRB) from the *National Cooperative Highway Research Project's (NCHRP) Report 457*.
- Section 1310.02(13)(a) *One-Way Left-Turn Lanes and Exhibit 1310-9 Left-Turn Storage Guidelines: Two-Lane, Unsignalized* from the WSDOT Design Manual.

Turn lane warrants were evaluated based on the number of advancing vehicles, the number of turning vehicles, the travel speed, and the number of through lanes.

Per the NCHRP and WSDOT methodologies, left turn lane warrants are projected to be met at the eastbound approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue under year 2026 conditions with the proposed zone change implemented. To accommodate this left-turn lane the existing median on the west intersection leg can be re-striped accordingly. Left-turn lane warrants are not projected to be met at any of the other study intersections. No other new left-turn lanes are necessary or recommended at these study intersections.

### Preliminary Traffic Signal Warrants

Preliminary traffic signal warrants were examined for the unsignalized study intersections to determine whether the installation of a new traffic signal will be warranted at the intersections under future year 2031 conditions.

Based on the preliminary analysis following a review of Warrant 1 in the *Manual on Uniform Traffic Control Devices*, or MUTCD, traffic signal warrants are not projected to be met at the unsignalized study intersections under year 2031 conditions with the zone change implemented. Therefore, no new traffic signals are necessary or recommended as part of the proposed comprehensive plan amendment/zone map change application.

# Operational Analysis

## Intersection Capacity Analysis

A capacity and delay analysis were conducted for the study intersections per the signalized and unsignalized intersection analysis methodologies in the *Highway Capacity Manual* (HCM)<sup>3</sup>. Intersections are generally evaluated based on the average control delay experienced by vehicles and are assigned a grade according to their operation. The level of service (LOS) of an intersection can range from LOS A, which indicates very little or no delay experienced by vehicles, to LOS F, which indicates a high degree of congestion and delay. The volume-to-capacity (v/c) ratio is a measure that compares the traffic volumes (demand) against the available capacity of an intersection.

### Performance Standards

According to City of Vancouver Municipal Code section 11.80.130 *Traffic Impact Analysis*, the City's performance standards include the following:

- B. A proposed development that adds at least five net new peak hour trips to an intersection approach operating at an LOS E or lower within the required traffic impact analysis area may be denied based upon any of the following:
  1. For signalized intersections, when off-site intersection conditions are at a LOS F, or
  2. For signalized intersections, when the LOS E and the volume to capacity ratio is greater than 0.95, or
  3. For unsignalized intersections, when the volume to capacity ratio for any lane on any approach is greater than 0.95, or
  4. When significant traffic hazards would be caused or materially aggravated by the proposed development, or
  5. Notwithstanding "a" through "d" of this subsection, traffic impacts to intersections on corridors built to ultimate capacity will be evaluated against the LOS standards identified in an adopted Corridor Management Plan.

### Delay & Capacity Analysis

The study intersections were analyzed utilizing methodologies and parameters detailed in the *WSDOT Synchro & SimTraffic Protocol*<sup>4</sup> document. Of specific note, the following peak hour factors (PHF) where incorporated in the analysis models:

- For existing year conditions, a PHF of no less than 0.80 was applied to each study intersection.
- For future year conditions, for study intersections where count data recorded a PHF of 0.90 or greater, the PHF was increased to 1.0. Where count data recorded a PHF of 0.89 or less the PHF was increased to 0.92.

---

<sup>3</sup> Transportation Research Board, *Highway Capacity Manual 6<sup>th</sup> Edition*, 2016.

<sup>4</sup> [WSDOT Synchro & SimTraffic Protocol \(wa.gov\)](http://WSDOT.Synchro&SimTrafficProtocol.wa.gov)

- To avoid showing a future year scenario with lower delays or v/c ratios than under existing conditions, when necessary the PHF for intersections under the existing year scenario was increased to 0.92.

The LOS, delay, and v/c results of the capacity analysis are shown in Table 6 for the AM and PM peak hours. Note the TrafficWare Synchro software utilized for analysis does not report the overall v/c ratio of signalized intersections in the HCM 6<sup>th</sup> Edition capacity reports. Therefore, the signalized intersection v/c ratios were calculated utilizing HCM 2000 methodologies. Detailed calculations as well as tables showing the relationship between delay and LOS are included in the appendix to this report.

**Table 6: Intersection Capacity Analysis Summary**

Analysis Scenario	AM Peak Hour			PM Peak Hour			
	LOS	Delay (s)	v/c	LOS	Delay (s)	v/c

Table Notes: **BOLDED** text indicates intersection operation above jurisdictional standards.

Based on the results of the operational analysis, all study intersections are currently operating acceptably per City of Vancouver standards and are projected to continue operating acceptably through year 2031, approximately five years beyond an assumed buildout year of the site following approval of the proposed zone change. Accordingly, no operational mitigation is necessary or recommended at the study intersections.

## Conclusions

No significant trends or crash patterns were identified at the study intersections that are indicative of safety concerns. Accordingly, no safety mitigation is recommended per the crash data analysis.

Adequate intersection sight distances are available at the site access approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue to allow for safe and efficient operation of the intersection. No mitigation is necessary or recommended at the intersection with respect to intersection sight distance.

Left turn lane warrants are projected to be met at the eastbound approach at the intersection of NE 63<sup>rd</sup> Street at NE 81<sup>st</sup> Avenue under year 2026 conditions with the proposed zone change implemented. To accommodate this left-turn lane the existing median on the west intersection leg can be re-striped accordingly. Left-turn lane warrants are not projected to be met at any of the other study intersections. No other new left-turn lanes are necessary or recommended at these study intersections.

Traffic signal warrants are not projected to be met at the unsignalized study intersections under year 2031 conditions with the zone change implemented. Therefore, no new traffic signals are necessary or recommended as part of the proposed comprehensive plan/zone map change application.

All study intersections are currently operating acceptably per City of Vancouver standards and are projected to continue operating acceptably through year 2031, approximately five years beyond an assumed buildout year of the site following approval of the proposed zone change. Accordingly, no operational mitigation is necessary or recommended at the study intersections.

Average time for making left-turn, s:	3.0
Critical headway, s:	5.0
Average time for left-turn vehicle to clear the advancing lane, s:	1.9

## Left-Turn Lane Warrant Analysis

Project: Wood Duck Springs CP/Zone Map Change  
 Intersection: 5. NE 58th Street at NE 82nd Avenue  
 Date: 11/12/2023  
 Scenario: 2031 Future Conditions with Proposed Zone - PM Peak Hour (WB)

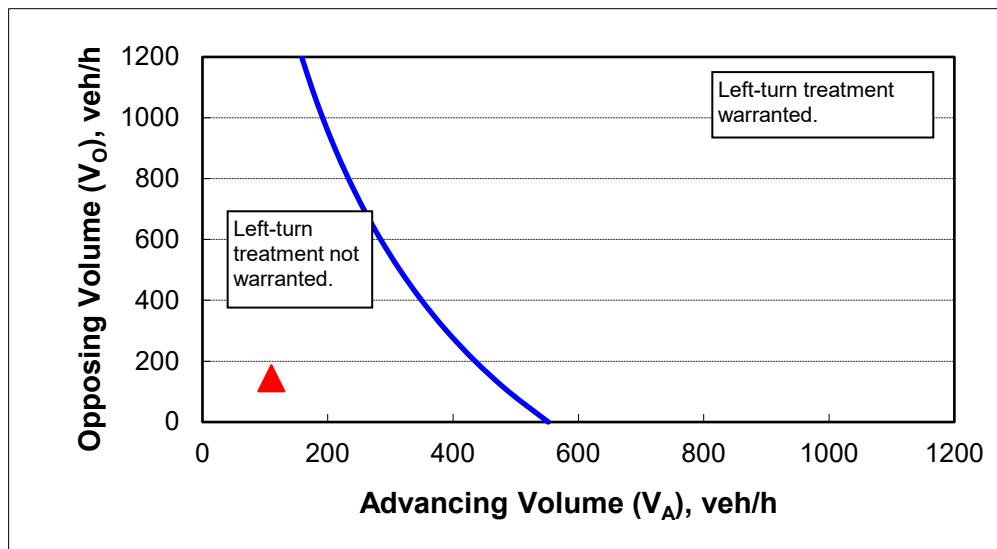

### 2-lane roadway (English)

#### INPUT

Variable	Value
85 <sup>th</sup> percentile speed, mph:	25
Percent of left-turns in advancing volume ( $V_A$ ), %:	84%
Advancing volume ( $V_A$ ), veh/h:	110
Opposing volume ( $V_O$ ), veh/h:	144

#### OUTPUT

Variable	Value
Limiting advancing volume ( $V_A$ ), veh/h:	464
<b>Guidance for determining the need for a major-road left-turn bay:</b>	
<b>Left-turn treatment NOT warranted.</b>	

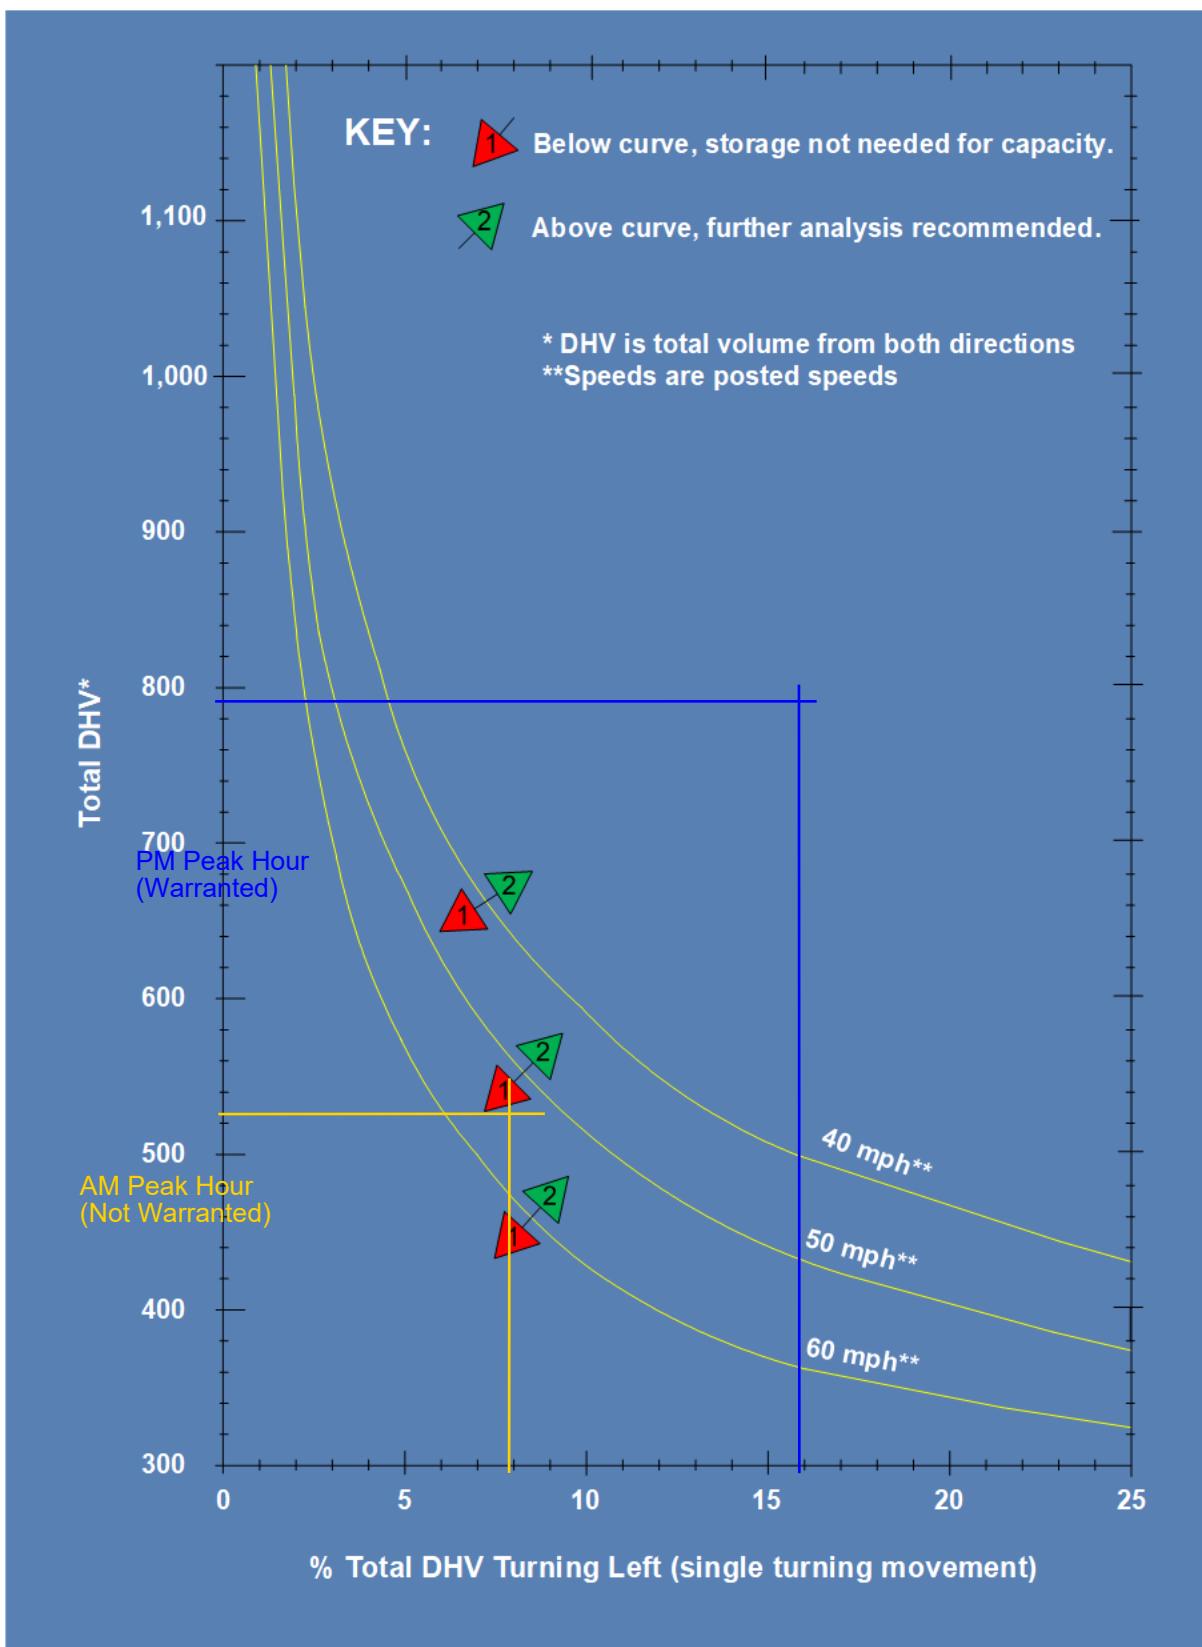

#### CALIBRATION CONSTANTS

Variable	Value
Average time for making left-turn, s:	3.0
Critical headway, s:	5.0
Average time for left-turn vehicle to clear the advancing lane, s:	1.9

Note: Minor street right-turning traffic volumes reduced by 25%.

## Appendix D – Operation Analysis

Level of Service Descriptions

Capacity Reports

## LEVEL OF SERVICE

Level of service is used to describe the quality of traffic flow. Levels of service A to C are considered good, and rural roads are usually designed for level of service C. Urban streets and signalized intersections are typically designed for level of service D. Level of service E is considered to be the limit of acceptable delay. For unsignalized intersections, level of service E is generally considered acceptable. Here is a more complete description of levels of service:

*Level of service A:* Very low delay at intersections, with all traffic signal cycles clearing and no vehicles waiting through more than one signal cycle. On highways, low volume and high speeds, with speeds not restricted by other vehicles.

*Level of service B:* Operating speeds beginning to be affected by other traffic; short traffic delays at intersections. Higher average intersection delay than for level of service A resulting from more vehicles stopping.

*Level of service C:* Operating speeds and maneuverability closely controlled by other traffic; higher delays at intersections than for level of service B due to a significant number of vehicles stopping. Not all signal cycles clear the waiting vehicles. This is the recommended design standard for rural highways.

*Level of service D:* Tolerable operating speeds; long traffic delays occur at intersections. The influence of congestion is noticeable. At traffic signals many vehicles stop, and the proportion of vehicles not stopping declines. The number of signal cycle failures, for which vehicles must wait through more than one signal cycle, are noticeable. This is typically the design level for urban signalized intersections.

*Level of service E:* Restricted speeds, very long traffic delays at traffic signals, and traffic volumes near capacity. Flow is unstable so that any interruption, no matter how minor, will cause queues to form and service to deteriorate to level of service F. Traffic signal cycle failures are frequent occurrences. For unsignalized intersections, level of service E or better is generally considered acceptable.

*Level of service F:* Extreme delays, resulting in long queues which may interfere with other traffic movements. There may be stoppages of long duration, and speeds may drop to zero. There may be frequent signal cycle failures. Level of service F will typically result when vehicle arrival rates are greater than capacity. It is considered unacceptable by most drivers.

*LEVEL OF SERVICE CRITERIA  
FOR SIGNALIZED INTERSECTIONS*

LEVEL OF SERVICE	CONTROL DELAY PER VEHICLE (Seconds)
A	<10
B	10-20
C	20-35
D	35-55
E	55-80
F	>80

*LEVEL OF SERVICE CRITERIA  
FOR UNSIGNALIZED INTERSECTIONS*

LEVEL OF SERVICE	CONTROL DELAY PER VEHICLE (Seconds)
A	<10
B	10-15
C	15-25
D	25-35
E	35-50
F	>50
